# ABSTRACT

INCO Exchange is a new Decentralized Exchange and Trading platform, powered by a pip order book fully On-chain and operating on Binance Smart Chain (BSC), aiming to bridge the gap between people and the crypto currency markets and enhance trading experiences. In its endeavor to become the decentralized exchange and trading platform of choice, INCO Exchange has developed a number of features that cater to all types of users while providing an easy to use great looking interface. Making it possible for everyone, no matter their level of knowledge and expertise, to take part in this proliferating and disrupting DeFi industry. The platform is designed to deliver all the advantages of Decentralized Finance whilst bringing the traditional Centralized Finance experience and tools onboard. INCO Exchange offers easy and accessible on-chain derivatives trading with high leverage, low slippage and low costs on Crypto assets and much more to come. The team behind INCO Exchange is setting a clear and specific vision involving meticulous planning for the development of the project.

**"Our Vision is to build the most decentralized and community driven platform in the DeFi industry, where every single user plays an important part in decisional process by having an effective role in defining and shaping INCO Exchange and its future development"**

" Our long-term view is what would set us apart from other startups. Guaranteeing the long term reliability of the platform and continuous benefits for INCO holders (native BEP-20 token to INCO Exchange) are our ultimate goals. INCO Exchange is introducing itself as a strong actor in DeFi , planning on rapid growth, sustainable expansion and aggressive business approach. We do understand that such plans and goals require continuous innovation, high flexibility and market adaptability. Our team is ready for the challenge. This article introduces INCO Exchange, the new DEX platform with its features, products, advantages and development plan.

## INTRODUCTION & BACKGROUND

With the proliferation of assets based on block chain, the need to exchange these assets has significantly increased amongst counterparties. As thousands of new tokens are introduced, including the tokenization of traditional assets and Commodities this need is amplified. Whether exchanging tokens for Speculative trading motivations, or converting to access networks via their native utility Tokens ,the ability to exchange one crypto asset for another is foundational for the larger ecosystem. Along with the fact that trading decentralized tokens and assets on traditional centralized exchanges (CEXs) fails to uphold the virtue of decentralized projects, CEX also comes with numerous risks and limitations. The three primary risks of centralized exchanges are lack of security, lack of transparency, and Lack of liquidity. DEXs have tried to work on these issues, and in many cases have succeeded in reducing security risks by using block chains for disintermediation. However, as DEX capability becomes crucial infrastructure for the new economy, there is substantial room for performance improvement and development. With the growing Ecosystem and low barriers to entry, DEX platforms saw a significant increase in their number over the past few years, leaving space for creativity and innovation. User centric applications become paramount. Users demand low transaction fees, fast and secure swaps and cross-chain compatibility, since the future of decentralized finance requires interoperability as a must-have feature. This surge and evolution included aggregating liquidity pools, smarter routing for trades, and access to multiple asset-specific order book algorithms to secure the best price and profitability for users. In the light of the above information, the team behind INCO Exchange decided to bring an innovative and visionary project to life.

## 1. Overview

Decentralized crypto currency exchanges offer many advantages, including anonymity and peer-to-peer transactions. But many are complex to use and hampered by low transaction volumes. As a result, clients looking for liquidity and simplicity are often forced to turn to centralized platforms, which lack proper authorization and suffer from inconvenient registration processes. INCO Exchange provides a solution to all that, along with a set of great features and products and aims to become the decentralized exchange and trading platform of choice. The core features of INCO exchange consist of on-chain Derivatives trading on Crypto assets as a start (with a plan to expand into other assets in the future), Staking, Farming, NFTs, Vaults, Exchange Pro and a unique on-chain Governance interface for holders to decide the future of the project.

## 2. What is INCO Exchange Perpetual Protocol (PEPP)?

INCO Exchange Perpetual Protocol or (PEPP) is the new fully Decentralized perpetual futures contract trading protocol powered by a pip Orderbook fully onchain, operating on Binance Smart Chain (BSC), bringing onchain derivatives to the DeFi Ecosystem. The prices of the derivatives are set automatically by the Orderbook which are based on an underlying Index Price. The Index Price consists of the average price of an asset, according to major spot markets and their relative trading volume, provided by Chainlink Data Feeds.

### 2.1 How does PEPP handle an on-chain orderbook?

In the existing works, many DEXs are trying to implement a significant order book pattern. Several types of DEX's orderbook were introduced: fully on chain, state channel, hybrid-orderbook or AMM. Due to the limitations of the blockchain, not many onchain order books generated significant volume except the AMM. However, an AMM still has problems with slippage, limit order and impermanent loss while providing liquidity

Due to the perpetual futures contract in particular, an orderbook is required to handle an efficient trading system. Hence, INCO Exchange would like to introduce a new design of the orderbook using bit mask and pip orders. This design aims to save gas cost as much as possible.

## 2.2 How does it work?

In the usual order book, there is a list of ask and bid orders stored in a map object for convenient matching orders. However, due to the limitation of a smart contract working on EVM, we have to store data in an efficient way. Inside the core of PEPP, there is a matching engine called INCOManager which holds a liquidity bitmap - a map of pip and liquidity. Each price is represented by a pip, Pip is an acronym for "percentage in point" or "price interest point." A pip is the smallest price move that an exchange rate can make based on market convention.

In EVM (Ethereum Virtual Machine), each variable is stored in 256 bit storage. A Liquidity Bitmap is a single slot packed with 256 bits; every single bit represents a boolean value marked for whether that bit has liquidity or not. This design helps find the nearest pip that has liquidity using a bitwise operator much faster and effectively. And in every pip, we store its liquidity volume and its pending orders used for matching orders.

### Limit/Stop Orders

#### INCO Exchange Order

Book offers Limit/stop capabilities, a native function rather than a second layer or integration. To open a limit order, the INCO Manager simply marks the pip that has liquidity and then inserts orders in the order list and increases the pip liquidity. This feature opens up a new room of possibilities previously unavailable to DeFi traders:

**No more missed opportunities:** In DeFi, asset prices can be very fluctuating and could very well move out of your targeted range. Limit Orders would automatically fill your order the moment your price range is reached.

**No more stressful always-on monitoring:** Due to the existence of many networks in the DEX, traders must keep an eye simultaneously on multiple platforms to keep up to date with market developments and make the right placements, which can be technically impossible. Using Limit Orders across all the connected platforms means automatic swaps when the price is right.

**No unplanned losses, less price impact:** One of the most efficient tools to control Slippage and avoid unexpected sudden change on the assets price. With Limit Orders, you get orders filled only at the price range you selected. With Stop Losses, you don't have to worry about price collapsing to zero overnight for exemple.

## Market orders

To proceed with market orders, the INCO Manager will find the liquidity in the liquidity bitmap. For either buy or sell orders, the INCO Manager will find the least or most significant bit starting from the current pip (current price).

## No liquidity providers needed

In conventional AMMs, liquidity is deINCOTed by liquidity providers contributing assets to facilitate trading; the liquidity in a INCO Manager Orderbook comes straight from the limit order. In simpler words, there is no need for liquidity providers to bring liquidity for an orderbook to work: the traders provide liquidity to each order. This orderbook feature is a good prevention tool against impermanent loss

## Managing slippage

With the INCO Manager Orderbook, traders are less exposed to slippage when market orders are able to fill at a certain price that the maker wants.

## Funding payment

The INCO Manager Orderbook itself acts as a self managed cash-settlement market. In order to make the INCO Manager market price close to an underlying index price, we need to add a funding rate.

The funding payments allow bringing the market price as close as possible to the underlying index price and make the orderbook market track it periodically. INCO Exchange Manager will be updating the funding payment and funding rate for 8 hours which will allow new derivative markets to trade with the applied leverage while closely tracking an underlying index.

## 2.3 Trading with INCO Exchange Protocol (PEPP)

The following diagram is describing the global functioning of INCO Exchange's Protocol and the connections between its different components.

### 2.3.1 Overview

Trader sends "x" USDT to the INCOHouse on INCO Exchange Protocol and specifies to use that amount as the margin to open a leveraged long/short INCO.

Upon receiving the "x" USDT, the INCO House deINCOs the funds into the Vault. After that, INCO Exchange Protocol proceeds to the asset price update in our Order Book depending on the margin amount, INCO type (long or short), and the leverage.

The deINCOted tokens are not stored inside our INCO House or INCO Manager. They are drained to the INCO Exchange Vault which interacts with the INCO Manager by providing the necessary data to value the traded assets.

This strategy makes sure that the tokens are safe in our virtual wallet (called Vault) to prevent losses that might occur following technical issues, outsiders attacks and potential system bugs in the INCO Manager or INCO House.

The sum of trader's gains equals other trader' s losses. Which is similar to the Traditional peer-to-peer futures trading mechanism.

The vault always has enough collateral to pay back every trader because one trader' s gain will cancel out another trader' s loss.

### 2.3.2 Opening a INCO (Long/short)

Assuming there is a BNB/USDT pair active in PEPP and the current price now is 499, Rick (market maker), Bob (market taker) both are interested in getting a short and long INCO.

## Limit

Rick, a market maker would like to get that short INCO by a limit order with 1000 USDT x10 leverage at the price of 500:

1. INCO House checks if Rick's wallet has enough funds (1000USDTs) then transfers the amount to INCO Vault and calls INCO Manager to open a limit order by marking that the price of 500 has 50 BNBs liquidity ( $1000 \times 10 / 500$ ).
2. Orderbook now updated by counting a bid order at the price of 500.
3. Vault's total reserve would be increased by 1000 USDT.

## Market

Bob, a market taker, is interested in getting a long INCO with 1000 USDT x10 leverage:

1. INCO House checks if Bob's wallet has enough funds (1000USDTs) then transfers the amount to INCO Vault and calls INCO Manager's market trade function with the size of 10,000 ( $1000 * 10$  leverage) USDT to INCO Manager in exchange for BNB

The BNB INCO Manager is referred to as BaseAsset, and USDT INCO in INCO Manager is referred to as QuoteAsset. According to Rick's order there is a bid order of 20.00 BNB (BaseAsset) at the price of 500 in INCO Manager, based on the calculations, 10,000 USDT are traded for 20.00 BNB and the price of BNBUSDT inside INCO Manager will increase to 500.

2. After INCO House "receives" the according amount of BNB, Bob's INCO would be updated to 20.00 LONG BNBUSDTs. And Rick's INCO would be updated to 20.00 SHORT BNBUSDTs.

3. Vault's total reserve would be increased by 1000 USDT after the completion of the trade.

### 2.3.3 Closing a INCO

The processes of closing and opening a short INCO are similar. The only difference is that the INCOHouse trades BNBUSDTs for USDTs when closing INCOs.

Assuming after Rick and Bob's entry order, lots of trades happened and pushed the price up to 510.

#### Limit

Now Rick is in loss of -200 USDT ( $20 \times 500 - 20 \times 510$ ), and he would like to open a limit close short INCO in order to take stop loss at the price of 520 which he will lose for -400 USDT.

1. Rick calls the limit close INCO function on the INCO House smart contract, and Smart contract validates the requirements for the closing INCO.

2. INCO House then calls INCO Manager to open a buy order at the price of 520.

3. INCO Manager marks the liquidity is available at the price of 520.

#### Market

Then after a while, the price now increased to 520, Bob is profiting of 400 USDT ( $20 \times 520 - 20 \times 500$ ) and interested in closing the 20.00 BNBUSDTs INCO he purchased:

1. Bob calls the close INCO function on the INCO House smart contract, and Smart contract validates the requirements for the closing INCO.

2. INCOHouse then calls the market sell function with the size of 20.00 BNBs in exchange for USDTs. According to Rick's closing order, based on the calculations, Rick order is filled and 20.00 BNB are traded for 10400 USDTs.

3. After the completion of the trade, the vault will decrease by 2,000 USDT.

- a. Bob will receive 1,400 USDT (profiting 400 USDT)
- b. Rick will receive 600 USDT (losing -400 USDT)

Note: Due to the limitation of the EVM smart contract, Rick needs to claim the fund manually after the limit close order is fulfilled avoiding Bob having to pay a high gas fee.

### **2.3.4 Insurance Fund**

The insurance fund is a key part of any exchange that allows leveraged trading. It plays a large role in crypto currency derivatives exchanges, both centralized and decentralized. The role of the such fund is to insure a smooth trading experience, even when markets are illiquid or experiencing extreme volatility.

There are three important figures to keep in mind to understand why leveraged trading requires an insurance fund: The liquidation price, the bankruptcy price and the closing price.

In a healthy market, with many buyers and sellers, and low slippage, A INCO will be partially liquidated before it passes its "bankruptcy" price, and the INCO will be partially sold below its liquidation price, but above its bankruptcy price.

(Partial liquidation prevents a user's INCO from suddenly getting liquidated by selling an amount of the INCO, after the partial liquidation, the user can decide whether to keep the INCO or not). The insurance fund receives the difference between the closing price and the bankruptcy price.

The insurance fund grows by = Closing price - Bankruptcy price

The insurance fund gains capital on liquidated longs when closing price > bankruptcy price. The opINCOte holds true for liquidated shorts. In illiquid or volatile markets, a INCO could be sold below its bankruptcy price. In this case, the insurance fund loses money in order to pay the counterparty winning trader. The "spread" is the difference between the lowest sell order and the highest buy order.

The insurance fund loses capital on liquidated longs when the closing price < bankruptcy price . The opINCOte holds true for liquidated shorts. In short, capitalizing the insurance fund is a shared cost for all traders who experience liquidations. In return, traders have the peace of mind knowing that they will always be able to receive their deserved profits. The Insurance Fund keeps a certain amount in reserve to pay the "spread" in case of losses. When the Insurance Fund's balance passes the reserve, it will use the residual amount to buy back and burn INCO tokens. In case the Insurance Fund does not have enough funds to pay the "spread", it will mint INCO token by its own and sell at the market price to make the liquidity for traders. The reserve amount which would be held by the Insurance Fund can be voted for by the community and can change over time.

## 3. INCO Exchange Token (INCO)

### 3.1 What is INCO? - A Token for the Community!

INCO is INCO Exchange's native BEP20 token empowering its ecosystem. In addition to being a utility token and providing liquidity and trading incentives, INCO token is designed to facilitate and incite the decentralized governance of the protocol. As such, holders of INCO tokens accrue voting rights proportional to their holdings

#### **A Deflationary token:**

Controlling the price of INCO as well as the total circulating supply of tokens will be our top priority. INCO Exchange's team is implementing several anti-inflation measures to keep INCO stable, encourage holding and ensure the best benefits of the INCO community. The measures include Anti-whale to prevent price manipulation, set a harvest lock up period to prevent farming arbitrage bots from constantly harvesting and dumping in addition to constant buying back and burning of INCO tokens and reducing block emission.

INCO Exchange will be running highly cost-effective incentive programs and initiatives to help facilitate and ensure the continuous growth of the platform and the INCO community. In the meantime, the INCO token will be the perfect vehicle for encapsulating and representing the value of the INCO Exchange's economy and ecosystem, and the collective value of the platform will be shared equitably and very generously with our loyal supporters.

As outlined in INCO Exchange's token distribution (Tokenomics), 15% of the INCO total token supply is reserved for the community. This is a substantial proportion and amount of tokens and it is hard to plan out all the incentive programs at first. As our platform continues to grow and users number to increase and more product features mature, the subject of value encapsulation will become more challenging.

This is why the INCO Exchange' s design is open to constructive suggestions and feedback from everyone, as we seek to grow alongside the community.

The Total supply of INCO tokens will be set at 100,000,000 tokens, starting with an emission rate of 5 INCO per block.

**- 3% Airdrop**

1,000,000 INCO tokens were distributed on the Airdrop as a first step. Participants registered in the white list lottery and took part in the exclusive public sale.

**- 15% Public Sale**

5,000,000 INCO tokens were available for public sale. The generated funds will be deployed to add Liquidity and support the Marketing strategy of INCO Exchange.

**-20% Team and Advisors**

The tokens will NOT be available to the team immediately but will rather be minted over time. INCO Exchange's team will retain a INCO of 10% of any newly minted token ensuring a community driven and fair launch. - 4% Liquidity The tokens will be immediately available for the general functioning of the platform.

**-8.26% Liquidity**

The tokens will be immediately available for the general functioning of the platform.

**-30% For the Ecosystem**

The vast majority of the INCO tokens will be dedicated to the Ecosystem through staking and farming development. This is one of the highest shares addressed to the community in the existing protocols!

# INCO EXCHANGE TOKENOMICS

## 4. DERIVATIVES in DeFi

Derivatives are financial contracts whose value is dependent on an underlying asset or group of assets. The commonly used assets are stocks, bonds, currencies, commodities, market indices and in recent years crypto currencies. The value of the underlying assets keeps changing according to market conditions. The basic principle behind entering derivative contracts is to earn profits by speculating on the value of the underlying asset in future.

The four major types of derivative contracts are options, forwards, futures, and swaps.

**Options:** Options are derivative contracts that give the buyer a right to buy/sell the underlying asset at the specified price during a certain period.

**Futures:** Futures are standardized contracts that allow the holder to buy/sell the asset at an agreed price at the specified date.

**Forwards:** Forwards are like futures contracts where the holder is under an obligation to perform the contract. But forwards are unstandardized and not traded on stock exchanges.

**Swaps:** Swaps are derivative contracts wherein two parties exchange their financial obligations. The cash flows are based on a notional principal amount agreed between both parties without exchange of principal.

In Defi, unlike in CeFi, there is no broker required. Instead, settlement automatically takes place on-chain, where the terms of the contract are fulfilled. The intersection of DeFi and derivatives is a gamechanger, bringing yet another borderless, low-barrier, financial instrument to the world.

Decentralized derivative markets are much more accessible. They can be used by anyone with an internet connection and an Ethereum wallet, no matter their location or social status. This contrasts with the traditional financial sector, which mostly serves those who reside rich and powerful countries. Creating a custom derivative in DeFi is easy, cheap, and can be done by anyone.

In the traditional financial system, the process for creating and listing a new derivative is very complex and costs involved are close to a million USD. Because of this, most derivatives are created by big banks which potentially can make it an unfair and inefficient market relative to DeFi. As mentioned in the Introduction, the rise of decentralized exchanges in recent years, solving several issues and surpassing limitations of the traditional centralized exchanges such as reducing security risks by using blockchains for disintermediation, has brought a lot of interest and attention and gave another fresh and new experience to derivatives trading.

INCO Exchange is designed to deliver all the advantages of decentralized finance whilst bringing the traditional centralized finance experience and tools onboard. The platform offers easy and accessible on-chain derivatives trading with high leverage, low slippage and low costs on Crypto assets and plans to expand into traditional assets, stocks and commodities in the future.

# 5. Decentralized Exchange (DEX) + Aggregator + Cross-chain Swap

## 5.1.Swap (DEX)

INCO Exchange Swap allows users to exchange their tokens fully on-chain through our dedicated interface in the website. Currently, we are using Pancakeswap DEX router and the exchanges happening via INCO Exchange swap interface reflect on Pancakeswap trade volume.

For all the transactions on INCO, the RFI technology is applied and therefore 1% transaction fee is charged on all INCO movements (Buy/Sell/Transfert). All the collected fees are reinvested to the protocol and the community through our innovative mechanism that redistributes all the RFI collected fees directly to the holders wallet proportionally the amounts they are holding.

Once the level of trade will reach high volume and once the project reaches the maturity state,the distributed amount would be considerable. This comes in line with our targeted strategy to encourage users to hold the token in counterpart of a passive income. FIOLD & EARN! The Swap feature will be developed over time and several functions are to be added in order to cover all the needs that a user might expect from a

## DEX. 5.2. Exchange Pro

Exchange Pro is a sophisticated and innovative version of the classic Swap/Exchange/DEX interface that includes many parameters and utilities that improves the quality of the users interface, provides more data on the dashboard and optimizes the use of the platform's features. Using Exchange Pro will allow you to have in hand a multitude of tools, visulas and key statistics (Tokens Charts,Instant Swap,KPI,etc...)

### 5.3. INCO Exchange Aggregator

Bringing an aggregator onboard our protocol is one of the brightest features that can have a great impact on the user's experience while trying to find the best deals and investment opportunities.

Making an investment decision, especially in the crypto field, requires some knowledge and techniques but the most important part of the Process will surely be related to data collection, treatment and analysis.

The market aggregator works as a search and optimization engine that collects data from several targeted sources and displays the optimal products/choices to the final user.

In simple words, INCO Exchange's Aggregator will browse through different markets where a token is listed and bring the best offers that might match your optimal investment by extracting data from different markets simultaneously .

### 5.4. Cross-chain Swap

The Cross-Chain Swap is an easy and practical mechanism that assists users and investors to migrate between different blockchains without the need of classic bridges. Most of the available bridges are offered by CEXs. They mainly allow users to bridge or transfer a specific token or coin from a blockchain network to another. Having a closer look to the principle of Bridges might give a quick feeling of a lack of flexibility to switch different tokens/coins between different networks and some additional costly steps that could be avoided using a Cross-Chain Swap.

## 6. NFTs

By definition, a fungible asset is a type of asset that is interchangeable with other assets of the same type. Currency is a fungible asset. After borrowing a \$100 bill, the borrower can return the amount either in a combination of bills of different denominations or in a different \$100 bill. The value of the dollar \$100 remains the same in both cases.

A non-fungible token in the world of blockchain technology and decentralized finance has been developed similarly. An NFT is the tokenized version of a nonfungible asset. Instead of a fiat currency like USD, AUD, or GBP, these tokens may represent artwork, real estate, or collectibles. Popular digital games, such as Decentraland and CryptoKitties, frequently leverage these tokens.

There are a few features that make a token non-fungible. To start with, the ownership of NFT is unique. It can not even be substituted by another matching NFT. These tokens are not separable. Every NFT has defined ownership and privileges.

### 6.1 NFTs in DeFi

NFTs are the next promising trend in the world of DeFi. It helps to expand market of collaterals in DeFi lending. In fact, a DeFi lending and borrowing platform requires collaterals. These collaterals are generally the crypto holdings. With the introduction of NFT, one can now put other types of assets as collateral. For example, an artwork or a real estate property can be tokenized as NFTs and put up as collaterals. The use of NFT goes beyond the realm of collaterals. It has the capability of representing more complex financial products.

## 7. Staking

Staking is an alternative to crypto mining. It consists of holding cryptocurrency in a digital wallet to support a specific blockchain network's security and operations. By 'locking' or putting away the cryptocurrencies, users can receive staking rewards. Rather than solving complex mathematical puzzles to keep the network secure, the PoS mechanism stimulates users to strengthen the blockchain network in exchange for a reward in the form of crypto. This reward also serves as an interest. The PoS mechanism allows users to generate a passive income only by holding coins as they earn crypto.

Typically, validators are selected to produce the next block based on the size and the average period it holds on their stake. Although there are other functions to prevent a front-running consensus, a larger stake usually gives users a higher chance of producing the blockchain's next block. Proposed blocks by validators are then propagated to the rest of the set, who verify and add the blockchain's approved block.

Users can generate passive income by staking their tokens in the Pool section. Each pool has a different APY. The process is fast & easy.

- # Go to the Pools page
- # Connect to your Binance Smart Chain compatible wallet
- # Choose which Pool you want to stake in.
- # Once you choose a pool, your wallet will ask you to confirm the action.
- # Type the amount INCO you want to stake.
- # The pools will show a Collect button to claim your staking rewards into your wallet

## 8. Farming & Vaults:

Yield farming allows the token holders to generate passive income by locking their funds into a lending pool for some interests as a return. While crypto staking involves a validate who locks up their coins, they can be randomly selected by the Proof of stake (PoS) protocol at specific intervals to create a block.

Yield farming is a practice allowing yield farmers to earn rewards by staking tokens and stablecoins in exchange to support the DeFi ecosystem. Yield farming, also known as liquidity mining, involves deINCOting and lending crypto underlying a mining mechanism to liquidate the liquidity pool for lucrative rewards.

While yield farming is comparably similar to staking's concept, there is an underline complexity associated with this mechanism. Contrary to crypto staking, yield farmers usually move their digital assets from one lending market to another in search of the highest yields.

Yield farming is never a standalone mechanism. It usually involves extensive participation of the automated market makers (AMM) — the liquidity providers (LP) that add funds to the liquidity pool from time to time to uphold the ecosystem.

The resemblance of the staking concept allows LP to earn rewards by facilitating the transactions in a block chain network.

## 9. Referral Program

In order to ensure an active participation of the community in the promotion plans of INCO Exchange, we are implementing a generous and attractive Referral program that allows all INCO holders, investors and community members to spread the word about INCO and earn a share of the incomes generated by their referrals on our dedicated platform.

INCO Exchange Referral program is applied to harvested Rewards in Single Staking Pool, Farms and Vaults. All members will be allocated a referral link connected to their wallets that they can share with other users and take part in the referral program by earning 5% of the harvested rewards by the referred users. We are setting in place a special Influencers Program where all Social Media Influencers,

Promoters, Youtubers can participate by submitting their request by filling the available form in the referral interface. Once the process is completed and approved, they will be able to benefit from 7% of the harvested rewards from all the users who accessed our platform through their referral link. Being a 100% community driven project, the referral program is one of the key strategies to attract more users to the platform and encourage community members to promote INCO and earn even more by just referring new users to the platform.

## 10. The Team behind INCO Exchange:

INCO Exchange is a decentralized platform designed for the community. The team members and collaborators behind the project are multidisciplinary and have extensive experience in Programming, Smart contract & Blockchain, Finance, Trading and Crypto industries along with a high understanding of economic conditions.

Located around the globe, we are trying to establish a userfriendly decentralization where transparency and cooperation are essential to thrive and achieve the main vision and mission together as a community.

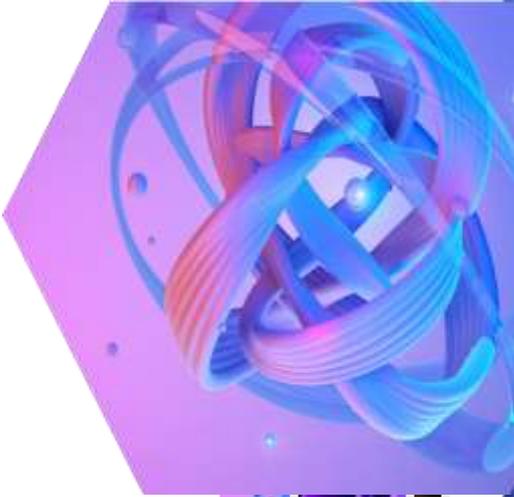

The team has decided to stay anonymous for the first steps of the project. This choice came out of a deep reflection about the nature of INCO Exchange and on how to build the trust around the potential of the project rather than individuals. We believe that every single individual participating in this project deserves to be cheered for his great efforts, dedication and participation either ways, close or far.

The Team will reveal the full identity of the core members once the project is standing on a strong community base. You have to remember we would be the "Most Decentralized Derivatives Trading Protocol" in the DeFi space, the real meaning of a 100% community driven project. The trust and confidence should not be put in the Team itself but in the project potential, the community around it and especially in our Code and Smart Contract. Being fully On-Chain and having an operating DAO guarantee the maximum of transparency and allow us to grow together as a Community in this amazing experience.

# ROADMAP OF INCO EXCHANGE

**THANK YOU**

**INCO  
EXCHANGE**
